

Problem: Our partner companies like to hire trained talent from us but for a long time it was done by sending resumes to companies via email. We have more than 50 companies now who want to hire from us so we can't send them resumes individually.

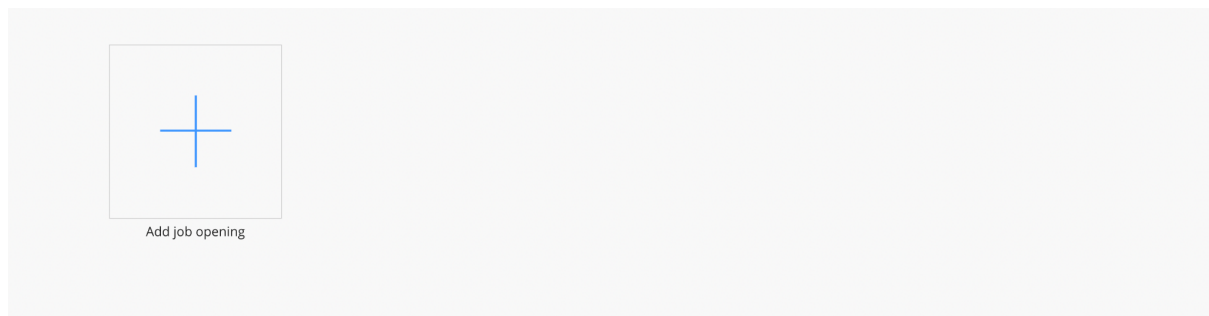

Our Solution: Let's make a CRM for companies where they can post a job and we can display a list of candidates to the companies.

Specifications: We will make a simple website where users can Log In/ Register and post a job opening. Once it has been done we can view them using an internal tool.

For V1 of the Web Application we need a Login/ Register flow. Once it's done, the user can post a job in 2 simple steps as shown below.

(Please use the below images for reference)

1- Tap on Add Job Opening

2- Fill the details related to the opening and tap on **Submit**

Job Role*
